9.Exploring AI-Assisted Features and Built-In Analytics (Zia)

1. Aim

To explore and integrate **Zia** (Zoho's built-in conversational AI assistant) and analytics tools into the **Job Application** (Recruitment Portal) built in Zoho Creator to leverage natural language processing, automated resume/field suggestions, and conversational analytics for hiring pipeline optimization.

2. Objective

- Understand how **Zia** brings artificial intelligence, machine learning, and natural language understanding into Zoho Creator applications.
- Utilize AI-assisted form design and smart field suggestions to optimize candidate data collection.
- Configure built-in analytics dashboards and use conversational queries to extract hiring metrics (e.g., active candidate volume, role-wise breakdown, and recruitment cycle times).

3. Tools Required

- **Zoho Creator Account** with Zia and AI capabilities enabled.
- **Job Application** containing historical recruitment records (candidate submissions, job openings, and interview feedback).

4. Procedure

Step 1: Leveraging Zia for Form and Application Optimization

Zia assists developers and administrators by interpreting natural language instructions to modify application schemas or recommend relevant fields.

1. Open your **Job Application** app in the Zoho Creator builder mode.
2. Navigate to the form builder for `Candidate_Application` or create a new interview evaluation form using **Zia Assistance**.
3. Use the **AI Field Suggestions** feature to automatically recommend standard or advanced fields (such as *Years of Experience*, *Expected CTC*, *Notice Period*, or *Key Technical Skills*) based on recruitment schema contexts.

4. Review the generated fields and click **Add** to incorporate them into the active form layout.

Step 2: Implementing Zia Tasks or Text Processing in Deluge

Configure intelligent data parsing or text analysis using built-in AI blocks.

1. Go to **Workflows** > **Deluge Script Editor** under your form workflows.
2. Explore or configure a **Zia Task** block within a script to handle text classification, automated resume summary extraction, or sentiment evaluation on interviewer feedback notes.
3. Map the parameters to process candidate text inputs dynamically upon form submission.

Step 3: Configuring Built-in Reports and Recruitment Analytics

To monitor applicant pipelines and recruitment performance using visual analytics:

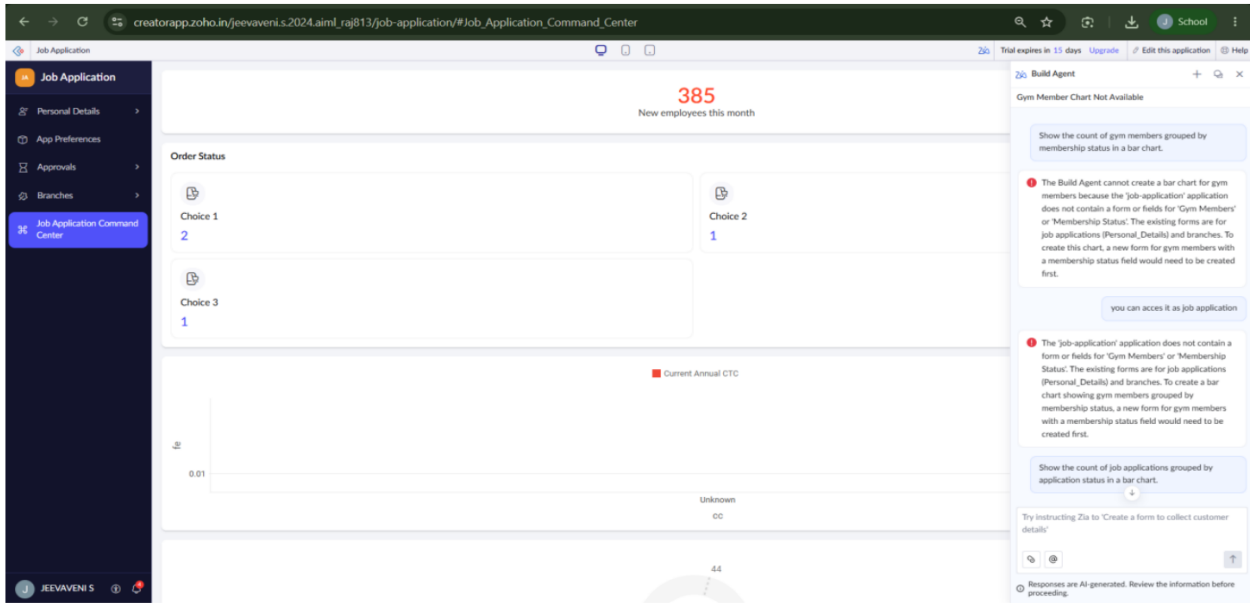

1. Click on the **Analytics** or **Reports** section within your Zoho Creator workspace.
2. Create a new **Chart Report** linked to the `Candidate_Application` data source.
3. Configure the visual layout parameters:

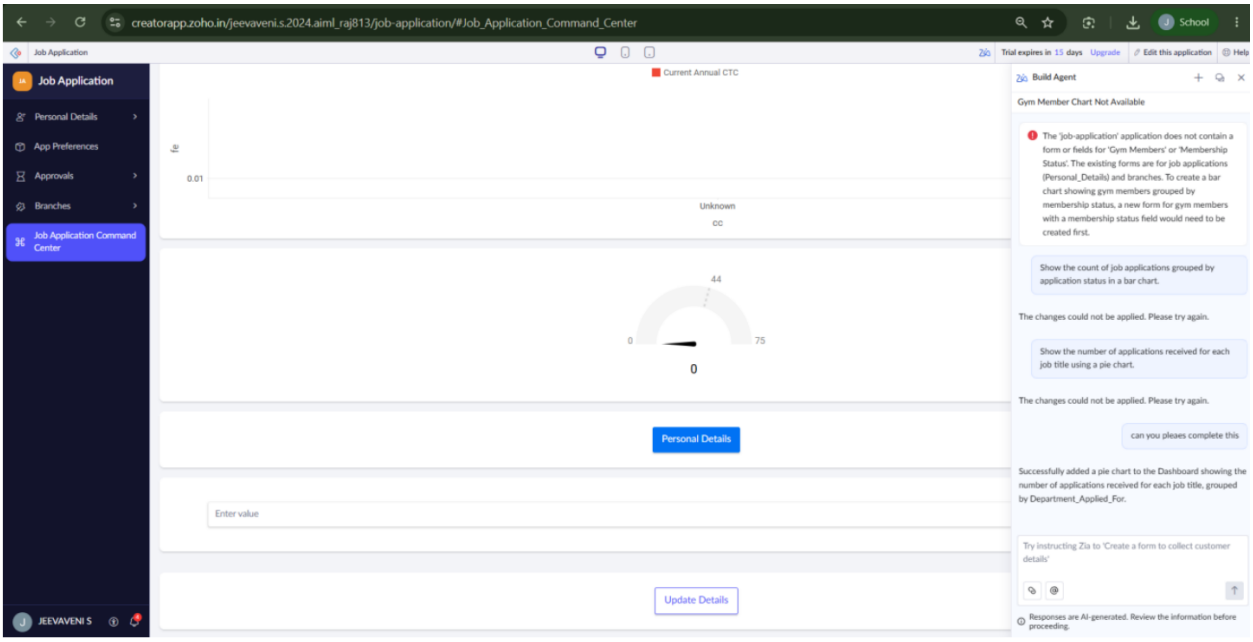

a. **Pie Chart / Bar Chart:** Categorizing applicants by `Job_Position` (Software Engineer, Data Analyst, QA Engineer).
b. **Funnel Chart:** Tracking applicant progression through stages (Applied, Screened, Interviewed, Offered, Hired).

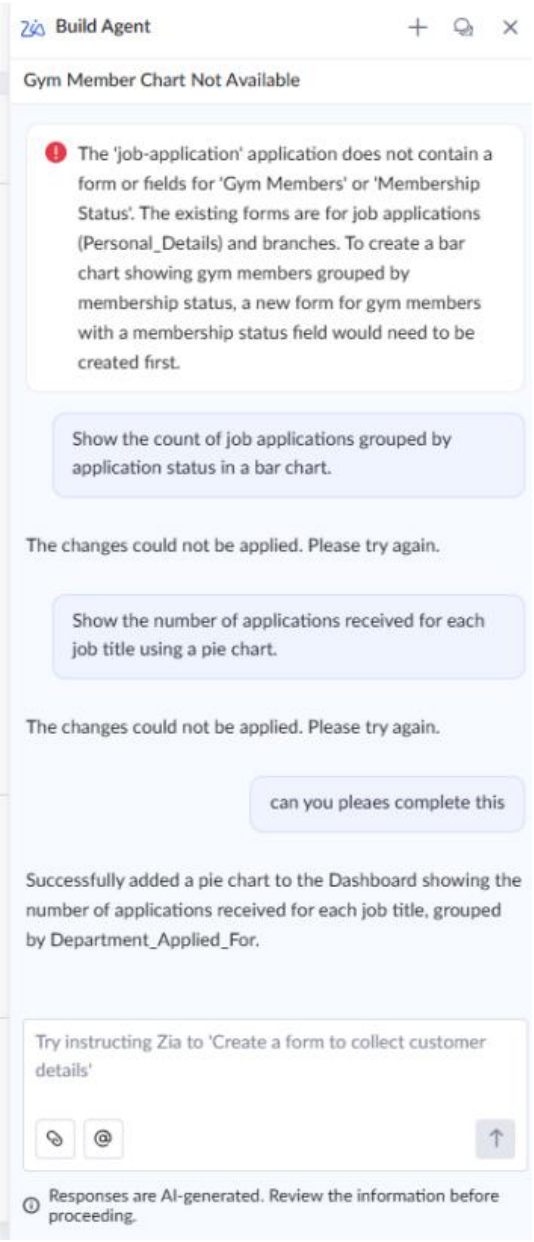

Step 4: Interacting with Data Using Zia Insights / Conversational Analytics

1. Access the dashboard view containing your recruitment reports.
2. Open the **Zia Insights** feature or conversational query interface to query your database using plain text prompts, such as:
   a. *"How many total applications were received for software engineering roles this month?"*
   b. *"Which department has the highest volume of pending interview evaluations?"*
3. Review the automated trend graphs, outlier anomalies, and statistical breakdowns instantly generated by Zia's machine learning engine.

Build Agent
Gym Member Chart Not Available
Show the count of gym members grouped by membership status in a bar chart.
The Build Agent cannot create a bar chart for gym members because the 'job-application' application does not contain a form or fields for 'Gym Members' or 'Membership Status'. The existing forms are for job applications (Personal_Details) and branches. To create this chart, a new form for gym members with a membership status field would need to be created first.
you can acces it as job application
The 'job-application' application does not contain a form or fields for 'Gym Members' or 'Membership Status'. The existing forms are for job applications (Personal_Details) and branches. To create a bar chart showing gym members grouped by membership status, a new form for gym members with a membership status field would need to be created first.

6. Result

AI-assisted features and built-in analytics via **Zia** were successfully explored and integrated into the **Job Application** system. This experiment demonstrated how conversational analytics, machine learning insights, and

smart field recommendations reduce administrative overhead and facilitate faster, data-backed recruitment decisions.
