11.Deploying a Zoho Creator Application from Development

1. Aim

To migrate, publish, and deploy the **Job Application** (Recruitment Portal) from the **Development Environment** to the **Production Environment** using Zoho Creator's deployment and migration tools, ensuring a seamless transition for live applicants and hiring managers.

2. Objective

- Understand the operational distinction between the **Development Environment** (where applications are built, tested, and modified) and the **Production Environment** (where live users and active recruitment data reside).
- Learn how to utilize Zoho Creator's **Environments / Application Migration** features to safely push schema changes, forms, reports, and scripts.
- Handle environment-specific configurations such as API connections (`zoho_recruit_connection`),

credentials, and user permissions during the promotion process.

3. Prerequisites & Tools Required

- **Zoho Creator Account** with Administrator or Developer privileges.
- **Job Application** fully built, tested, and debugged in the Development environment.
- Target **Production Environment** provisioned within the same Zoho Creator organization.

4. Step-by-Step Implementation Procedure

Step 1: Pre-Deployment Verification and Clean-Up

Before migrating any application components to production, ensure the build is stable and clean.

1. Open your **Job Application** app in **Development Mode**.
2. Run final functional tests across all forms (`Candidate_Application`, `Interview_Feedback`), reports, and Deluge workflows (such as Zoho Recruit integration and RBAC permissions).

3. Review the **Script Execution Logs** to guarantee zero compilation errors or unhandled exceptions.
4. Clear out temporary test records or dummy applicant entries so the production database begins with a clean operational slate.

Step 2: Accessing the Deployment / Environment Promotion Tool

Zoho Creator provides structured deployment pathways depending on whether you utilize sandbox environments or direct publishing.

1. In the application builder home screen, navigate to **Settings** > **Environments** (or **Publish**).
2. If utilizing Zoho Creator's multi-environment framework:
    a. Select your **Development** workspace.
    b. Click on the option to **Deploy to Production** (or **Promote Changes**).
3. If publishing a standard application build:
    a. Click the **Publish** button located in the top-right header of the builder interface.

Step 3: Reviewing Component Changes and Dependencies

When the deployment wizard initiates, Zoho Creator scans the workspace and displays a migration summary.

1. Review the list of modified components queued for production deployment:
    a. **Forms & Fields** (e.g., `Candidate_Application`, resume uploads, job position dropdowns)
    b. **Reports & Dashboards** (e.g., candidate pipeline charts and Zia insights views)
    c. **Workflows & Deluge Scripts** (e.g., automated `invokeurl` functions pushing data to Zoho Recruit)
2. Ensure that external service **Connections** (such as `zoho_recruit_connection`) are verified and re-authorized for the production environment if required, as sandbox tokens do not automatically bridge over.

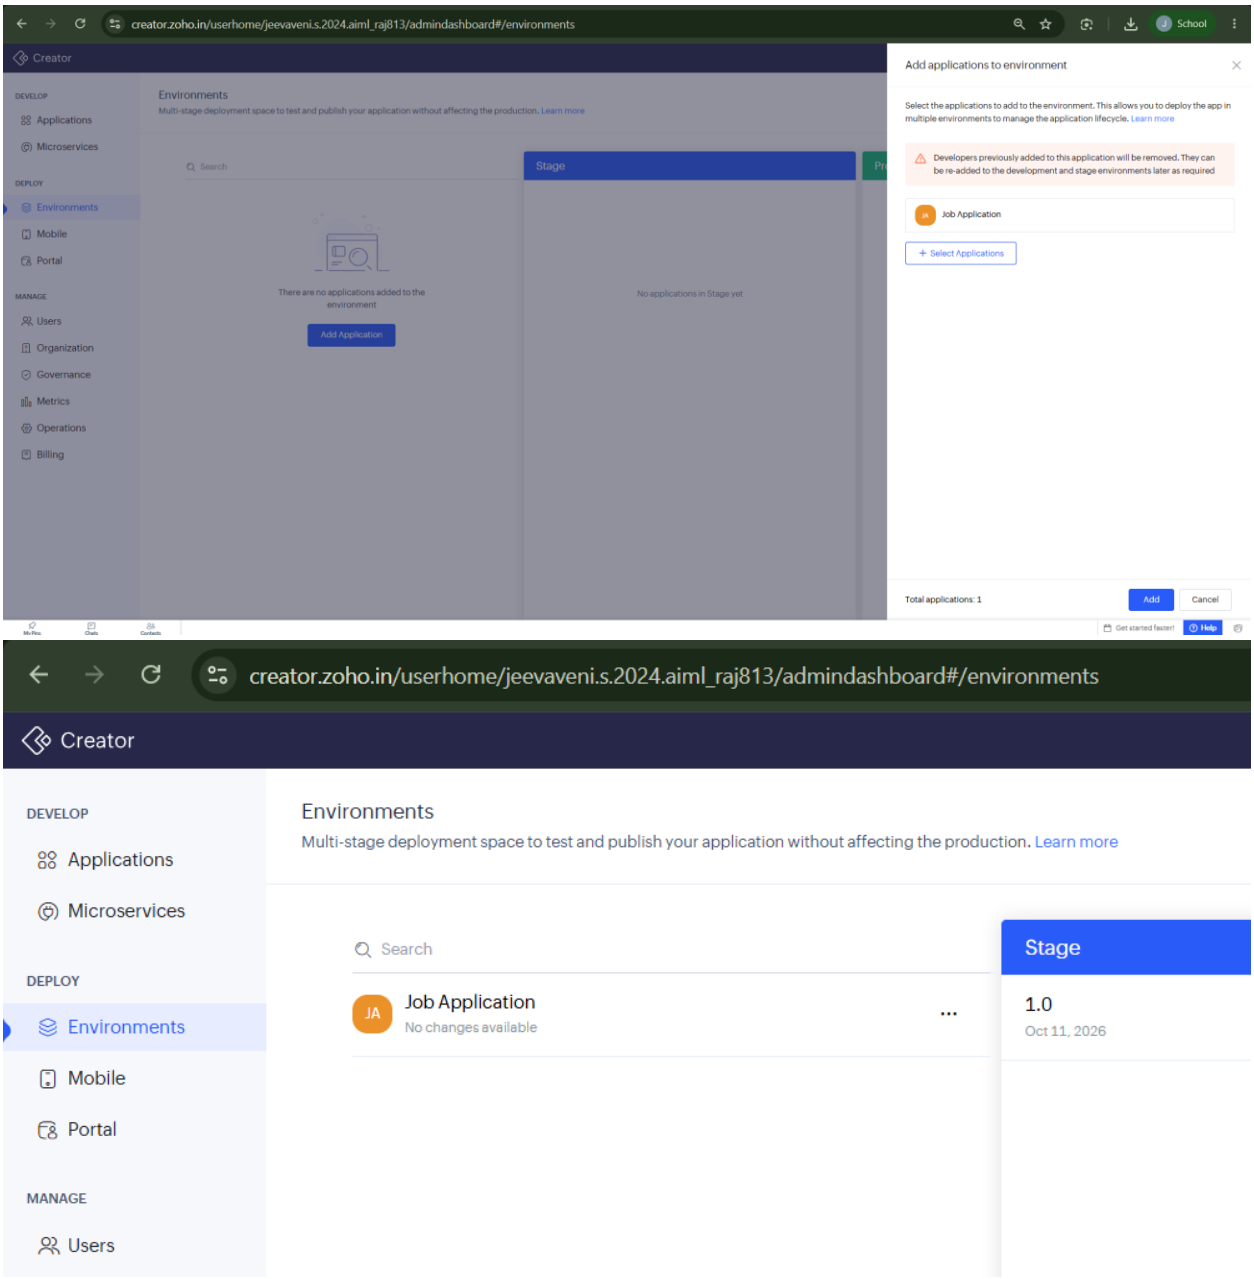

Step 4: Executing the Deployment

1. Click **Confirm & Deploy** (or **Publish Application**).
2. Allow the background compilation and synchronization process to finish. A success notification will appear confirming that the production environment is updated.

Step 5: Post-Deployment Access and Sharing

1. Switch your active view to the **Production Environment** URL or click **Access Live Application**.
2. Confirm that the application URL points to the live production domain rather than the development workspace.
3. Re-verify initial production users and roles under **Users & Permissions** to ensure RBAC rules (*HR Manager*, *Interviewer*, *Candidate*) function correctly in production.

6. Result

The **Job Application** system was successfully promoted and deployed from the development workspace to the production environment. This experiment highlights structured Application Lifecycle Management (ALM) best practices, ensuring that recruitment updates and integrations are thoroughly vetted before reaching live candidates and interviewers.
